13.12.82-SU-549238 (23.09.84) CO4b-15/06 Light-weight silicate bricks prodn. mixt contains lime, dune screened porous argillite sand, calcined argillite dust and water	rand,	conductivity is reduced from 0.67-0.88 to 0.55. Bul.35/23.9.84 14pp Dwg.No 0/0)
CR5-040021		

Light weight silicate bricks are made from lime, dune sand, porous argiliste sand, additives and water. The bricks are stronger and more thermally insulating, if they are made from the following base (wt.%): Jime 5.89-8.78, dune sand 22.26-47.98, porous argillite sand (1) 29.0-45.75, calcined argillite dust (11) 3.69. 11.27, remainder - water. (1) should have the following particle size analysis: size 2.5-5mm 4-6 wt.%, size 0.31-0.63 mm 20-28 wt.%, size 0.63-1.25 mm 8-30 wt.%, size 0.60-0.14 mm the remainder.

Dust (II) consists of amorphosised black-brown, acld, aluminosilicate gluss, mixed with non-amorphosised, red-brown tumescent clay granules containing Fe oxides, spinels, olivines and biolites etc. (II) reacts readily with Ca(OH)2 to give Ca hydrosilicate and aluminates, which prevent carbonate films forming on the brick surface. The bricks are pressed and correspond to USSR Spec. GOST 379-79.

correspond to USSR Spec. COSA 518-19.

ADVANTACE The strength of the patented bricks is no receased by 30-70% (to 18 mps); the coefft, of thermal
